

Dentistry and dental technology are embracing automated and digital technology in a manner that is more accelerated than anything I have experienced in my 38 years in the profession. A system that we began evaluating last October is the Staub Cranial procedure. With this system, your cases, whether dentures, full mouth reconstruction, implants, diagnostic wax ups or temporization, will benefit from a Staub analysis.

From your end, there is nothing else to do ... in fact you will send less to us. You will find that tooth placement and positioning coupled with vertical dimension that is perfect will be achieved by measurements that we take of anatomical landmarks of your patients models. We will not require bite blocks on removables or bite registrations on reconstructive cases.

A verbal or written description makes it sound very abstract. However the proof is in the results. We believe that after you complete a case or two, you will begin to "trust in the Staub." We are incorporating the Staub into our Artisan departments. When you request our Artisan work, you will get the Staub analysis plus the finest materials available. For example in removables, each case will be finished in Ivocap and you will have a selection of our highest end teeth.

In crown and bridge we will be using Creation Porcelain that can be layered and internally characterized. Space is not available to list all the benefits of the Staub. We invite you to experience the results for yourself and look forward to your feedback. Both dentistry and dental technology have often ventured into new systems. Here is one we can recommend without reservation.

— Joe Thierry, CDT

Our standard products of excellence can be analyzed by the Staub. However, when you have patients who demand the best, just specify Staub and our Artisan departments.

Staub® Cranial System

The Dentogenic Concept

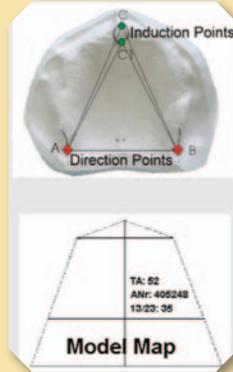

Laser Fabrication

Creation Porcelain™

Our technicians achieve exceptional color stability for full crowns, inlays, onlays and veneers using Creation porcelain, even when multiple firings are required.

Creation porcelain provides an incomparable level of esthetics. We often use this system for customized restorations that use many powders in a build-up.

Staub™ Cranial

The accuracy of the Staub™ Cranial system lies in the fact that the system uses cranial reference points which are reproducible parameters. Our technicians are able to mathematically calculate tooth placement and vertical dimension using these parameters. This system ensures a highly accurate and predictable restoration every time, and can be applied to both fixed and removable restorations.

Procera®

bridges and implant bridges

by Nobel BioCare's Procera combine strength and esthetics and provide an excellent fit. Up to 14 units can be fabricated. This highly biocompatible material is recommended for enhanced soft tissue integration and can be used anywhere in the mouth.

Dentogenic Concept

Gender, age and personality are the important considerations in Dentogenics. This approach enables the dentist to create a restoration that is in harmony with the patient's personality restoring dignity and individuality. Dental Systems Group uses this approach on all restorations.

Ivocap® Processing

With SR Ivocap, chemical shrinkage is not an issue.

This system is based on a special injection technique that is capable of compensating for chemical shrinkage. Controlled heat/pressure polymerization compensates acrylic shrinkage by pressured feeding of additional material.

IPS Empress and e.max

Because of numerous benefits, and high precision and esthetic appearance, IPS

Empress and IPS e.max ceramics have evolved into the highest standard for patients and dental professionals. These systems have a reputation for producing long-lasting, natural-looking results and maintaining the highest quality.
